

CA Manager

PRIVATE PKI OPERATIONS CONSOLE

BUILT FOR LABS, SANDBOXES, AND INTERNAL TOOLING

**CERTIFICATE AUTHORITY CONTROL
WITHOUT THE SPREADSHEET DRIFT**

Run a practical private CA for lab environments.

CA Manager gives lab teams a browser-based place to issue, track, revoke, and inspect private certificates without turning every PKI task into a command-line archaeology project.

See the hierarchy

Root and intermediate CAs, ownership, status, and certificate lineage in one console.

Keep teams moving

Fast issuance, renewals, CSR intake, revocation tracking, and export workflows.

WHY IT FITS LAB PKI

A focused control plane for private certificates.

Designed for internal infrastructure, development stacks, homelabs, platform experiments, and test environments where teams need visibility, repeatable workflows, and sane guardrails.

01

Issue and import CAs

Create root and intermediate CAs, import existing assets, retire older authorities, and keep records together.

02

Track leaf certificates

Manage expiry, SANs, service ownership, environments, renewals, exports, and revocation status.

03

Control access

Use roles, teams, LDAP-backed users, service accounts, and optional security-key step-up for CA actions.

04

Automate safely

Expose scoped API keys, policy-bound ACME, SCEP enrollment, audit trails, and CRL/OCSP endpoints.

Inspect what is live

TLS Probe checks a host, validates the chain against managed CAs, and shows whether the certificate is recorded.

Give automation an identity

Service accounts and API keys support repeatable certificate jobs without sharing human passwords.

Best fit environments

- > Dev and test infrastructure
- > Internal platform experiments
- > Ephemeral service stacks
- > Homelab services
- > Training and demo PKI
- > Non-critical private apps

Stand up a private CA with fewer blind spots.

Use it when OpenSSL alone is too manual, but public-trust CA ceremony is more than the lab needs.

For non-critical private PKI. Not a public-trust CA or bank-grade PKI platform.
